ABSTRACT

In this study, the application of fuzzy logic in statistical quality control have been done by plotting fuzzy P chart depending on a suggested algorithm prepared for this purpose and applied that on data of (401) patients of laboratory tests about heart providing with blood (T.C., H.D.L, L.D.L, T.G.). The data distributed into (25) samples, each sample of (50) patients, each patients had four observations. The chart of the tests compound in one chart called Lab. Test.

The results were compared with Shewart chart of P type for defective proportion (Lab. Test). Also the data were tested for normality using probability plots test. The control limits was expanded to include standard limits ($\pm 3\sigma$) and more accurate limits ($\pm 1.6\sigma$, $\pm 2\sigma$). The sensitivity of fuzzy P charts was compared with Lab. Test.

The comparing results that fuzzy P chart have the same accuracy and sensitivity of classical P chart (Lab. Test) and the suitable control limits of this chart is ($\pm 2\sigma$).
